# **Security in mobile computing**

---

**LECTURE 4**

**Mobile Device Vulnerabilities**

# COMMON MOBILE SECURITY THREATS

- There are different security threats in different parts of the mobility landscape:
  - **Web-based** mobile threats.
  - **App-based** threats.
  - **Network** threats.
  - **Physical** threats.

**What** are the most common mobile threats and what are the **EMM** best practices to **prevent** or **mitigate** them?

**Note:** **Enterprise mobility management (EMM)** is the set of people, processes and technology focused on managing mobile devices, wireless networks, and other mobile computing services in a business context.

# COMMON MOBILE SECURITY THREATS

# 1. LOST OR STOLEN DEVICES

- The most basic threat to physical device security is also the most common, **loss or theft**.
- **Biometrics** and **kill-switches** are reducing the incidence of mobile device theft.

# LOST OR STOLEN DEVICES PREVENTION / MITIGATION

<b>Strong Password Policies</b>	Enforce <b>complex device passwords</b> to prevent unauthorized parties from using <b>manual/brute-force</b> techniques to guess the password and gain access to the device.
<b>Enforce Encryption</b>	<b>Encrypt data</b> to prevent extraction from the device.
<b>Disable USB (applicable for Android and Windows devices)</b>	<b>Disable USB</b> to prevent access to sensitive information via <b>USB debugging</b> , prevent side loading of malicious files/programs and prevent download of information from the device's storage.
<b>Real-time Location Services (RTLS)</b>	Configure <b>geographic boundaries</b> for company-owned devices. If the device <b>leaves the approved area</b> , an <b>EMM solution can automatically lock it down, wipe</b> sensitive/confidential information and/or notify appropriate personnel.
<b>Kiosk/Lockdown</b>	<b>Lockdown the user interface</b> of the device to prevent access to <b>apps</b> and <b>settings</b> that may compromise the functionality of the device, or the <b>data</b> on the device and to improve the user experience.

## 2. JAILBREAKING / ROOTING

	What does it mean?	Why do device users do this?
<b>Jailbreak</b>	Remove software restrictions put into place by <b>Apple</b> ™ on devices that run the <b>iOS</b> operating system.	<ul style="list-style-type: none"><li>• Customize user experience and expand functionalities.</li><li>• Gain access to a greater variety of unofficial apps.</li><li>• Unlock SIM cards in order to use the device with another carrier</li></ul>
<b>Root</b>	Remove software restrictions put into place by <b>Google</b> ™ to gain the ability to replace the entire operating system.	<ul style="list-style-type: none"><li>• Carry features over from one device to another.</li><li>• Remove system apps that typically cannot be uninstalled.</li><li>• Unlock SIM cards in order to use the device with another carrier.</li></ul>

# JAILBREAKING / ROOTING PREVENTION / MITIGATION

<b>Jailbreak/Root Detection</b>	An <b>EMM agent</b> will <b>block enrollment</b> and notifies the IT manager if a device is <b>Jailbroken/Rooted</b> .
<b>Wipe Content</b>	An EMM solution's secure document manager and secure browser will <b>block access to content and wipe downloaded content</b> if the device is <b>jailbroken/rooted</b> .
<b>OS Patching/Updating</b>	Identify and segregate devices running <b>old/vulnerable OSs</b> and <b>limit</b> the settings and apps pushed to the devices <b>until they receive suitable OS updates</b> .
<b>Integration with Device Attestation Services</b>	An EMM solution integrates with <b>device attestation services</b> to verify the integrity of the hardware, firmware and OS.

### 3. MAN IN THE MIDDLE ATTACK

- A man-in-the-middle (MITM) attack can **listen** in, or even **alter** the traffic going to and from a mobile device. The most common way for this to happen is over **public, unsecured WiFi** networks.

# MAN IN THE MIDDLE ATTACK PREVENTION / MITIGATION

<b>Whitelist WiFi Access Points</b>	<b>Pre-configure</b> devices with approved <b>WiFi</b> access points and restrict the device user from creating new <b>WiFi</b> connections or modifying existing <b>WiFi</b> connections, effectively creating a <b>white list/safe</b> list of <b>WiFi</b> access points to which the device can connect.
<b>Disable Bluetooth Pairing</b>	Mitigate Bluetooth vulnerabilities by temporarily <b>disabling Bluetooth communications</b>
<b>Disable Access to Websites with Invalid SSL/TLS Certificates</b>	Prevent MITM attacks by <b>using secure browser</b> to avoid connecting to sites with certificates that are untrusted.
<b>Configure and Enforce VPN/ per-app VPN</b>	To <b>secure communication</b> even over <b>insecure/ compromised</b> networks.

# 4. MALWARE

**Malware** is the catch-all term for dozens different types of potentially harmful applications (**PHA**).

The most common are:

- **Trojans**; opening a backdoor, rooting/ jailbreaking, keylogging/spying, and spreading botnets for **DDoS** attacks.
- **Ransomware**; An external user takes over and **locks down something you need**, whether it's important data or a critical system. You are then required to **pay money**.
- **Adware / Clickware**; is a potentially unwanted program that displays **pop-up ads** and **unwanted advertisements** on web pages that you visit or may track your online activity.

# MALWARE PREVENTION / MITIGATION

<b>Antivirus Protection</b>	An integrated antivirus solution can offer <b>scanning, quarantining</b> and <b>deleting</b> of infected files or apps.
<b>Whitelist/Blacklist apps</b>	Define a <b>list of apps</b> that <b>can/ cannot be installed</b> and run on devices,
<b>Prevent Installation of Untrusted Apps</b>	<b>Create approved enterprise app catalogs</b> that device users can use to install pre-approved public app store and in-house apps. <b>Prevent</b> end-user side <b>loading of apps (via USB)</b> or installation of app from unauthorized app stores.

# 5. PHISHING / SOCIAL ENGINEERING

- **Social engineering** is a manipulation technique that **exploits human error to gain private information**, access, or valuables • Attacks can happen **online**, in-person, and via other **interactions**.

## PREVENTION / MITIGATION

<b>Web Filtering</b>	<b>Use secure browser and whitelisted / blacklisted domains</b> or categories of sites to minimize the chances of a user accessing a malicious or compromised site.
<b>Disable Access to Websites with Invalid SSL/TLS Certificates</b>	<b>secure browser</b> will block access to sites with invalid certificates.

# 6. DATA LEAKAGE

- **Data leakage** : is the **unauthorized transmission of data** from within an organization to an external destination or recipient.

# DATA LEAKAGE PREVENTION / MITIGATION

<b>Multi-factor Authentication</b>	Use <b>multiple modes of authentication</b> (passcode, biometrics, ID services) to confirm the end user's identity before enrolling the device and deploying settings and software.
<b>Certificate-based Authentication</b>	<b>Mutual certificate-based authentication</b> establishes trust between managed devices and the EMM server. Provision devices with identity certificates to secure access to company resources, such as <b>WiFi</b> and <b>VPN</b> .
<b>Secure Email Gateway</b>	<b>Use an EMM email gateway to secure on-premise MS Exchange email</b> and ensure email can only be accessed from managed and compliant devices.
<b>Content Management Apps</b>	Use an EMM solution's secure document manager and secure web browser to prevent sharing of sensitive information within corporate files and websites. <b>Encrypt corporate files and web content on the device</b> , and wipe downloaded content when a device is retired, rooted or jailbroken.
<b>Enforce Separation of Work and Personal Data and Apps</b>	<b>Prevent sharing of data from company apps and emails accounts to personal apps</b> and emails accounts on the device.

# 7. BYOD

**BYOD (Bring Your Own Device)**: is the increasing trend toward **employee-owned devices within a business**. Smartphones are the most common example but employees also take their own tablets, laptops and USB drives into the workplace.

## PREVENTION / MITIGATION

<b>Formal BYOD Policy</b>	Around 60% of companies have formal <b>BYOD policies</b> . Even in the absence of EMM, a BYOD policy can reduce many security risks.
---------------------------	--

# MOBILE SECURITY CHECKLIST

<b>Hardware/OS</b>	<ul style="list-style-type: none"><li>✓ Enforce <b>complex password</b> policies</li><li>✓ Enforce <b>encryption</b> of internal storage and removable SD card(s)</li><li>✓ <b>Disable USB access</b> on dedicated purpose devices</li><li>✓ <b>Update/patch OS</b> (if supported by the device)</li></ul>
<b>Apps</b>	<ul style="list-style-type: none"><li>✓ Apply a <b>company-branded kiosk</b> on dedicated purpose devices to limit access to settings and apps Update/patch apps</li><li>✓ <b>Disable side loading</b> of apps or installation of apps from <b>3rd</b> party apps stores</li><li>✓ <b>Blacklist unapproved apps</b> on BYOD or company-owned personally enabled (COPE) devices</li></ul>
<b>Content</b>	<ul style="list-style-type: none"><li>✓ Use <b>an EMM email gateway</b> for Exchange email</li><li>✓ Enforce <b>app sharing restrictions</b> to prevent data leakage from business apps and email accounts</li><li>✓ Use of an <b>EMM secure document manager</b> and secure web browser to grant secure access to corporate files and websites</li></ul>
<b>Communication</b>	<ul style="list-style-type: none"><li>✓ <b>Disable Bluetooth pairing</b> if not required for the device, or if unpatched Bluetooth vulnerabilities are identified</li><li>✓ Configure and enforce <b>VPN/per-app VPN</b></li><li>✓ <b>Whitelist WiFi access points</b> on dedicated purpose devices</li></ul>
<b>Cyber threats</b>	<ul style="list-style-type: none"><li>✓ Use <b>an EMM secure browser and block access to unapproved categories of websites</b> (e.g. gambling websites) or websites with invalid certificates</li><li>✓ Enable/Configure antivirus protection</li></ul>

# Steps to Protect Your Mobile Phone

- **When choosing a mobile phone, consider its security features.**
  - Ask the service provider if the device **offers file encryption**.
  - The ability for the **provider to find and wipe the device** remotely.
  - The ability to **delete known malicious apps remotely**.
  - Authentication features such as **device access passwords**.
  - look for an option to **encrypt the backup**.
  - If you plan to use the device for VPN access, ask the provider if the device **supports certificate-based authentication**.
- **Configure the device to be more secure.**
  - Enable **PIN and password feature** that locks the device.
  - Enable **encryption**,
  - remote **wipe capabilities**,
  - **antivirus software** if available.

# Steps to Protect Your Mobile Phone

- **Configure web accounts to use secure connections.**
  - Accounts for certain websites can be configured to use secure, encrypted connections (look for “**HTTPS**” or “**SSL**” in account options pages).
- **Do not follow links sent in suspicious email or text messages.** Such links may lead to malicious websites.
- **Limit exposure of your mobile phone number.**
  - Think carefully before **posting your mobile phone number to a public website**. Attackers can use software to collect mobile phone numbers from the web and then use those numbers to target attacks.

# Steps to Protect Your Mobile Phone

- **Be choosy when selecting and installing apps.**
  - Do a **little research** on apps before installing them.
  - Check what **permissions** the app requires.
- Do not “**root**” or “**jailbreak**” the device.
- **Disable** interfaces that are not currently in use, **Bluetooth**, infrared, or **Wi-Fi**.
- Set **Bluetooth**-enabled devices to **non-discoverable**.
- **Avoid** joining **unknown Wi-Fi** networks and using **public Wi-Fi** hotspots.
- **Carefully consider** what **information** you want stored on the device.
